Adam Amin

adamamin54@gmail.com | +1 (949)-656-6010

Computer Engineer B.S. and Software Engineer with experience in embedded software development and cybersecurity.

Skills

Programming Languages: Bash, C, C++, C#, Go, Java, JavaScript, HTML/CSS, Python, Rust, TypeScript
Technologies and Tooling: Linux, Git, Docker, GitLab, GitHub Enterprise, SSH, Nix
Web Development: Bun, Node, Tailwind, React, Vue, Vite, Yarn
Architectures: x86, ARM
Protocols: BLE, SPI, I^2C, UART
Simulation Tools: MATLAB, OrCAD, KiCAD, PSpice, Synopsis
Agentic Coding: Claude Code, Codex

Education/Certifications

University of California, Riverside – Bachelor of Science in Computer Engineering December 2024
NCEES Fundamentals of Engineering – Electrical and Computer Engineering Certification **In Progress**

Experience

Software Engineer, Quantum eMotion – Temecula, CA September 2026 – *Present*

- Developed on and tested a **quantum-safe VPN gateway** solution.
- Developed **hardened container images** for security and reliability in production environments.

Software Developer, Planet Innovation – Melbourne, AU July 2025 – May 2026

- Worked on an embedded Linux system for industrial peristaltic pumps, utilizing Yocto Project to integrate our Python apps.
- Facilitated software development using tools such as MQTT, Docker containers, Python virtual environments, and GitLab CI/CD.
- Created nightly test suites in Robot Framework, **increased test coverage by 20%** and reduced manual testing efforts.
- Automated release notes generation for tagged software builds, **saving approximately one day of documentation** per release cycle.
- Leveraged Claude Code to accelerate development workflows and feauture implementation.

Quality Assurance, Promenade Software – Irvine, CA June 2020 – August 2022

- Worked on the DxTerity COVID Project, a high-priority initiative to develop a web-based solution for purchasing test kits and securely storing COVID-19 related data.
- Ensured software quality by designing and executing test cases, identifying bugs, and verifying fixes.
- Produced Python scripts to automate the testing process and reduce manual efforts.

Projects

Synthesizer - FRDM K64F Microcontroller

- Built a digital synthesizer using the FRDM-K64F microcontroller by implementing signal processing algorithms in C.
- Designed the circuit using hardware allowing for adjusting volume and adding effects to the audio signal.
- Utilized ARM Cortex-M4 capabilities for real-time audio synthesis and debugging with GDB.

Volumetric Display - Raspberry Pi 5

- Designed a 3D visualizer using a Raspberry Pi 5 to display real-time images and video.
- Integrated TouchDesigner for live visualization, debugging and user interaction.
