Adam Amin

adamamin54@gmail.com

Computer Engineering B.S. graduate with experience in Software Engineering.
Seeking entry-level roles for Software Engineering, Embedded Systems Engineering, and Software Test Automation.

Software Engineering Skills

Programming Languages: C, C++, C#, Go, Java, JavaScript, HTML5/CSS, Python, Rust, TypeScript, Zig
Technologies and Tools: Linux, Git, Docker, GitLab
Web Development: Bun, Node, Tailwind.css, Vue.js, Yarn
Hardware Description: ARM, x86, MIPS, Verilog
Embedded Protocols: BLE, SPI, I2C, UART, ZephyrOS, FreeRTOS
Simulation and EDA Tools: MATLAB, OrCAD, KiCAD, PSpice, Synopsis
Agentic Coding Tools: Claude Code

Education/Certifications

University of California, Riverside – Bachelor's of Science in Computer Engineering December 2024
NCEES Fundamentals of Engineering – Electrical and Computer Engineering Certification **In Progress**

Experience

Software Developer, Planet Innovation – Melbourne, AU July 2025 – May 2026

- Worked on Project Archimedes, which involved software implementation of an existing embedded Linux system for industrial peristaltic pumps.
- Utilized Yocto Project to build light-weight embedded Linux images and integrated into our Python applications.
- Facilitated software development using tools such as MQTT, Docker containers, virtual environments, and GitLab CI/CD.
- Developed nightly test suites in Robot Framework, **increased test coverage by 20%** and reduced manual testing efforts.
- Automated release notes generation for tagged software builds, **saving approximately one day of documentation** per release cycle.
- Leveraged Claude Code to accelerate development workflows, reducing feature implementation and iteration time.

Quality Assurance, Promenade Software – Irvine, CA June 2020 – August 2022

- Worked on the DxTerity COVID Project, a high-priority initiative to develop a web-based solution for purchasing test kits and securely storing COVID-19 related data.
- Ensured software quality by designing and executing test cases, identifying bugs, and verifying fixes.
- Produced Python scripts to automate the testing process and reduce manual efforts.

Projects

Synthesizer - FRDM K64F Microcontroller

- Built a digital synthesizer using the FRDM-K64F microcontroller by implementing signal processing algorithms in C.
- Designed the circuit using hardware allowing for adjusting volume and adding effects to the audio signal.
- Utilized ARM Cortex-M4 capabilities for real-time audio synthesis and debugging with GDB.

Volumetric Display - Raspberry Pi 5

- Designed a 3D visualizer using a Raspberry Pi 5 to display real-time images and video.
- Integrated TouchDesigner for live visualization, debugging and user interaction.
- Now iterating on the design to improve performance and functionality.
